

# Acceleration of Basic Health Access Not Deceleration

Robert C. Bowman, M.D.

A T Still School of Osteopathic Medicine in Arizona

Basic Health Access

# For Most States, For Primary Care, and For Populations in Need: Workforce is Workfarce

- Instate focus lacking COGME 21/GME Reviews
- Primary care worst case scenario
- Lower concentrations 25 states, best for 8
- 2900 counties left behind with 68% of US pop
- Steenrod - no progress in rural health access
- Rural health problems now spread universally

# How Can Continuity Longitudinal Training Help?

Accelerated FM facilitates such training

- Best for instate
- Most primary care visits
- Best for where Needed
- Most health access recovery/least grads
- Most relevant training specific to need
- Best support for front line clinicians
- Team focus of training

# Continuity Longitudinal Training

- Optimal when integrated within the context of the community for training and practice
- Also helps to illustrate the importance of tens of thousands of visits that shape physicians after graduation – far more specifically than current training
- Self training specific to patient after patient after residency is much more important for FM where graduates are permanent to primary care and are highest probability where needed

# Instate, Primary Care, Where Needed = Social Determinants Where Needed

- Health spending redistribution requires filled family practice positions – only pop based form
- Economic impact
- Social determinants shape cost, quality, access
- Equity vs inequity by health spending design
- Wrong workforce = inequity and higher cost by more graduates and more financial incentives

# 1990s Accelerated Family Medicine

- Traditional preparation, admission, 3 years MS
- Candidate commits to FM specific training
- FM Department/Program selects – not match
- Combination of MS-4 with PGY-1 year
- 4:3:3 design instead of 4:4:3
- 1 year less training, 1 year more practice
  
- Instate medical school and FM residency at the same site, and often instate origins

# Accelerated FM Programs

- Little support and had opposition
- Expanded to over 15 sites with little support
- Same or superior academic outcomes
- Moratorium/termination before understanding, illustration of medical education failure to grasp continuity design crossing accreditation bounds
- Note COGME 21 suggests MS4<sup>th</sup> year for GME

# Selection Criteria for the Study

- Accel grads in the Masterfile – Identified by 2 year difference in medical school and residency grad date – combined MS-4 with the PGY1 year
- 136 accelerated grads identified using 11 sites
- 1 known site (SC) was not identified using this
- About 70% from comparisons of numbers at programs with this method
- 2 Accels disappeared – no response from MMS

# Comparison Groups – Specific to Class Year and State Environments

- Not FM - Same Class Years of Medical School
- For FM - Same Class Years of FM N = 22,705
- Most specific - Those from the same medical school and same residency as Accel Grads
- Same State Workforce - Same states with accelerated training – AL, KY, NC, NE, OH, TN, WV – 6 out of 7 states with major workforce issues from US medical ed design failure

# Summary - Accelerated FM as Measured 9 – 16 Years After Graduation

- Stays like FM – in specialty and in same county
- Tens of thousands more PC visits like FM
- Likely better distribution than FM to locations with lowest physician concentrations
- Maximal instate, primary care, where needed, jobs and economic impact where needed

# Accelerated States AL, KY, NC, NE, OH, TN, WV Have Greater Instate, PC, where needed

| 1994 – 2000 Medical School Graduates            | US Pop / Accelerated State Pop |  |                               |                   |

# Simple Solutions - Population Based Training, Population Based Distribution

- Medicare, Medicaid, poverty, less educated
- Uninsured and Underinsured (ACA)
- Fastest increasing US pops – 2900 counties with less than 300 physicians per 100,000, faster increase in primary care demand
- Top concentration focus fails
- Continuity, longitudinal, instate, family practice positions filled

# Perhaps Familiarity Breeds – Distribution?

- Does familiarity before, during, and after training may lead to practice where needed
- Those not familiar with a state may not be as likely to go to a state, or where needed in a state
- Proper Controls Can Help

# Is the Advantage the Result of Accelerated Programming?

- Examine same medical school and same residency but not accelerated
- Examine % Instate in the Masterfile and Logistic Regression with regard to Instate

# FM Grads By Physician Concentration

| Physicians per 100,000        | 450+         | 300 - 450    | 150 - 300 | 1 - 150      |
|-------------------------------|--------------|--------------|-----------|--------------|
| Accelerated Same MS/Residency | 18.8%        | <b>14.3%</b> | 23.3%     | <b>43.6%</b> |
| Same MS and FM Residency      | 14.6%        | 21.1%        | 24.7%     | <b>39.7%</b> |
| Same FM Residency Diff MS     | 18.7%        | 23.3%        | 27.0%     | 30.9%        |
| Same MS Diff FM Residency     | 13.3%        | 21.3%        | 36.7%     | 28.8%        |
| Not Accelerated               | 13.7%        | 22.2%        | 41.7%     | 22.4%        |
| Not Primary Care              | <b>32.5%</b> | 26.6%        | 30.5%     | 10.3%        |

# Instate, Local for 2005 Locations Compared to 2013 Locations

| After 9 – 16 years of practice                        | Same County | Same State | Different State |
|---|-------------|------------|-----------------|
| Same State Medical School and FM Residency n = 208    | 63.1%       | 18.9%      | 17.2%           |
| Accelerated FM with same state for MS and GME n = 133 | 62.1%       | 24.2%      | 13.6%           |

It is difficult to show differences between any type of FM graduate – stay in family practice and in their practice locations – as demonstrated when matching up controls

# Examine Instate Results for Accelerated States

- Instate Birth Origins or Not
- Instate Medical School or Not
- Instate GME or Not – regardless of FM
- Is it accelerated design – or continuity longitudinal design instate, primary care, where needed?

# Instate Location % By Instate GME (All Specialties), Instate Med School, Instate Birth

# Origins, Med School, GME Instate for Instate, FM for Primary Care and Where Needed

- What Matters is Medical School to Residency Instate linking origins, training, and GME
- Accelerated designs link instate determinants
- FM is key for retention in primary care and for primary care where needed, where linking up instate factors may help
- FM shapes retention in same county

# But Accelerated and All Current FM Choices Are Voluntary

- Small tracks just lead to selection bias
- Current admissions inappropriate, current first and second year are inappropriate, current year 4 is a waste in many dimensions
- Incremental improvements are not enough

# Specific to Instate and Most Americans

- Specific FM medical schools align preparation, medical school, residency, instate obligation – maximal instate, primary care, where needed
- Why not 3:3:3 all continuity and longitudinal?
- Maximal primary care recovery for minimal cost
- Maximal social determinants through family practice positions filled – and bigger and better teams and jobs and businesses where needed

# Sufficient Primary Care for 2050 & Beyond

| 300,000 SPCYRs or 600 million visits per Class Yr | SPCYRs/Grad | Grads Required | Billions in Training Cost | % Rural |

# Choices for Sufficient Primary Care

| About 90 primary care physician equivalents per 100,000 people | SPCYRs/ Grad | Grads Required | Billions in Training Cost | Rural Incent |
|--|--------------|----------------|---------------------------|--------------|
| Specific FM 3:3:3  | 27.9         | 10,748         | \$9.7                     | Least        |
| Current Training Expanded                                      | 6.1          | 49,500         | \$31.5                    | Most         |
| Physician GME Design   | 4.7          | 64,400         | \$32.2                    | Most         |
| Advanced Graduate Nursing                                      | 3.0          | 100,000        | \$50.0                    | Most         |
|  |              |                |                           |              |
| Current Generic Training Not Sufficient 200,000                | 7.0          | 33,000         | \$21.3                    | 15.0%        |

# Specific Designs for Specific Needs

- States in most need of primary care are paying 1 – 2 dollars more per person for locums, recruitment, retention – expense increases over 1 million dollars more each year in states in most need (State of Alaska)
- But no increase in primary care workforce
- Loan repayment/administrative costs for distribution are a part of the problem
- Solution is instate, primary care, where needed

# The 4 Year FM GME Demo Will Decrease Primary Care Yield

- Increase cost and debt, decreased income and primary care yield at 3 – 5% loss
- Half of 3000 PGY3 residents take PGY4 for 1500 PGY4 positions. 500 lost PGY1 positions per year – 500 family physicians less per class year times 33 class years for this design change to be fully expressed – reduction from 91,000 FM to 75,000
- If increases of FM GME funding, then 1500 positions would be best spent on 500 more per class year for 500 more FM grads a year

# Actual Instate, Primary Care, Where Needed By Design

- Theoretical is not reality, more health spending would be needed for primary care and for locations where needed to fund the family practice positions needed and their support
- Advantage - permanent family practice position
- Instate, primary care, where needed design forces accountability from other states and from institutions that steal what they need from most Americans, most states, and the rest of the world

# Continuity Longitudinal

- Maximal boost to primary care delivery
  - More visits/health access efforts facilitated
  - Fewer transitions
  - Trainee is additional team care member
  - Training specific to populations in practice
- Additional support factor could aid site in
  - Decreased clinician and team member turnover
  - Life long learning
  - Trainees become colleagues and replacements

# Class Year Considerations Are Important

- You cannot change primary care after a class year has graduated and has entered practice – if set points of graduate numbers and primary care retention are too low, it is too late
- If graduates leave primary care in later years, esp family practice positions – disastrous
- 2 chunks of 30,000 lost – NP/PA to teaching hospital, 30,000 to hospitalist (24,000 IM), other thousands to ER, urgent, retail
- Also losses to low volume primary care

# Why FM? – See Primary Care Visit Result

| 2013 Grads                 | Years in Career | % Retained in Primary Care | % Active as Office Clinicians | % Volume per FTE | Standard Primary Care Years | Estimated Career PC Visits |

# Why Shorter FM Training?

- Less cost of training – 10 to 20%
- More years of practice 1 – 2 or 3 to 6% more
- More activity – 1 to 2% possible
- More distribution – better to much better
  
- Better ratio of cost of training per primary care visit over a career
- Can be even greater for ratio per primary care where needed – more visits, less cost of training

# FM vs NP or PA

- FM is still 90% family practice position
- NP or PA is 25% family practice position
- NP is 33% not a clinician, 33% primary care clinician, 33% non-primary care clinician
- PA is 30% not, 30% PC, and 40% non-PC clinician
  
- NP and PA moving to more specialties with more in each specialty, with only 25% family practice result – critical for care where most needed
- such as 28 - 30% of FP PA or NP found in rural practice. But only when staying in family practice positions

# Permanent Family Practice Result

- For MD, DO, and PA as low as \$10 training cost per primary care visit, slightly higher for NP
- Flexible designs cost more due to low PC yield
- Increasing NP training by 2 years will result in 30% more costs and 8% less visits – for a higher \$64 cost compared to \$49 per visit
- FM, NP, PA for 50 years have had decreased PC result and distribution with longer training
